

Face emotion processing deficits in schizophrenia: identification and remediation utilising visual scanpath technology

Kathryn Louise McCabe (BSc)

**A thesis submitted in fulfilment
of the requirements of the
University of Newcastle
for the degree of
Doctor of Philosophy**

January 2012

**Research undertaken at the
Priority Research Centre for Brain and Mental Health, University of
Newcastle, Callaghan, NSW, Australia**

STATEMENT OF ORIGINALITY

*The thesis contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. I give consent to this copy of my thesis, when deposited in the University Library**, being made available for loan and photocopying subject to the provisions of the Copyright Act 1968.*

***Unless an Embargo has been approved for a determined period.*

SYNOPSIS

Social cognition deficits in schizophrenia are now widely accepted as both a core feature of the condition and an area lacking effective treatment regimes. The aim of this thesis was to explore novel strategies for the remediation of one aspect of social cognition, namely face emotion processing. We utilised visual scanpath technology to first characterise the nature and extent of face emotion processing dysfunction in a schizophrenia sample (Chapter 2). In this study we sought to determine whether the visual scanpath deficits observed to face emotion stimuli generalise to complex, socially relevant stimuli that are matched on component features and response dimensions. The data presented in Chapter 2 showed support for the generality of information processing dysfunction in schizophrenia to complex visual stimuli. After establishing the generality of higher order object recognition dysfunction, we examined in Chapter 3 whether generalised scanpath impairment is likely to be associated with other measures of basic visual processing. The findings from this investigation showed that measures of smooth pursuit eye movement (SPEM) and scanpath behaviour during recognition tasks were significantly associated. The findings from these empirical studies guided the development of a novel remediation strategy targeting face emotion recognition. The treatment utilised visual scanpath technology to provide biofeedback designed to enhance the quality and sampling of visual information. This strategy was compared to an existing face emotion remediation tool. The data from the study described in Chapter 4 provides preliminary evidence that computerised biofeedback-based

training markedly improves recognition and information processing functions associated with face emotion perception in schizophrenia. In conclusion, this thesis provides the first evidence of the utility of both “top-down” and “bottom-up” approaches to the remediation of social cognition deficits in schizophrenia.

ACKNOWLEDGMENTS

I would like to thank my supervisors Dr. Carmel Loughland and A/Prof. Mick Hunter for their support and guidance during my candidature. A particular debt of gratitude is owed to Carmel for the unwavering support she has shown during this process. I look forward to a long and fruitful collaboration and friendship. Thanks are also due to my second supervisor A/Prof Mick Hunter. His knowledge, expertise and calm have been the welcome voice of experience during difficult times.

As with any work of this size and technical complexity there are a variety of people whose help, advice and support has been indispensable. I would like to thank Mr. Terry Lewin for sharing so generously his remarkable expertise. Thanks are also due to the Schizophrenia Research Institute who provided me with financial support through the Natasha Snow Postgraduate Scholarship, and in particular the Snow family for their in memoriam contribution towards schizophrenia research. Thanks are also due to Gavin Cooper of SRI for assisting me with programming and technical support. A special mention is also needed to Vanessa Case, Dr Linda Campbell, Mary Claire Hanlon, Dr Ross Fulham, Paul Rasser, Prof Ulli Schall, Dominique Rich, Liesl Duffy and Dr Matt Hughes for their support and company during the daily grind of this research.

I would also like to thank my siblings Alison, Natalie, Paulette, Jennifer, James, Adrian and Matthew, their partners and my nephews and nieces for the gift of

their unconditional love and support. To Mum and Dad, you have given your children a simple brief: be happy, with no judgement, demands or expectations attached. Only as an adult have I understood the remarkable generosity of this gesture. Thank you. I love you. I hope I can make you proud.

To my very dear friends – Hannah and Mick, Belinda and Justin, Sara, Abi, Rachael, Alison, Claire and Mick, Elena and Rhyall, Phoebe and Joey, you have been a wonderful distraction and continue to be a constant source of inspiration. Thank you. A special thank you to Min for the care and guidance you have shown. I love you. Finally, this acknowledgement would not be complete without a note to my beloved Massimo, who lies snoring at my feet while I write these words. A PhD is quite a solitary experience and his presence has made it that little bit more bearable.

Yours,
Kathryn
