

**THE EVALUATION OF METAL ION COMPETITION ON  
THE FLUORIDE REMOVAL FROM SOLUTIONS USING  
NATURAL MOLECULAR SIEVE AND CALCITE**

by

**Qianqian Cai**

**B.Eng.**

A thesis submitted for the degree of  
**Doctor of Philosophy**  
at the University of Newcastle  
**October, 2015**

---

## DECLARATION

*I hereby certify that the work embodied in this thesis is the result of original research and has not been submitted for a higher degree to any other University or Institution.*

*I hereby certify that the work embodied in this thesis contains published paper of which I am a joint author.*

## Acknowledgements

First of all, I would like to express my sincere gratitude to my supervisors, Dr. Brett Turner, Professor Daichao Sheng, Associate Professor Kristian Krabbenhoft and Professor Scott Sloan for their constant support, encouragement and guidance. Special thanks go to Dr. Brett Turner, without his patient instruction, the completion of this thesis would not be possible, and it has been my pleasure to work with him.

I am grateful to Dr. Xianfeng Liu for his valuable advice in this project, and thanks also to Dr. Shaun Manning, Dr. Michele Spadari, Andy, Lachlan, Shengyang and all other ED staff for their contribution to my laboratory studies.

I would also like to acknowledge the financial support from the Australian Research Council (ARC), Hydro Aluminium and the University of Newcastle. Thanks to the X-Ray Unit at the University of Newcastle for X-ray Diffraction Analysis.

Many thanks go to all my friends met in Australia. Because of them, my life here becomes more colourful and impressive. I appreciate all the experiences that I came cross during the past four years.

Last but not least, my gratitude also extends to my beloved family for their understanding, supporting and endless love.

## TABLE OF CONTENTS

LIST OF FIGURES .....	VII
LIST OF TABLES.....	XIV
ABSTRACT .....	XVII
CHAPTER 1 INTRODUCTION .....	1
CHAPTER 2 LITERATURE REVIEW.....	6
2.1 ALUMINUM SMELTING .....	6
2.2 SPENT POT LINING (SPL) WASTE .....	7
2.2.1 <i>Chemical composition of SPL</i> .....	7
2.2.2 <i>Disposal and treatment of SPL</i> .....	8
2.2.3 <i>SPL contamination near Kurri Kurri</i> .....	9
2.2.4 <i>In situ remediation – permeable reactive barriers (PRBs)</i> .....	14
2.3 FLUORIDE.....	16
2.3.1 <i>Drinking water standards</i> .....	17
2.3.2 <i>Fluoride contamination</i> .....	17
2.3.3 <i>Methods of fluoride removal</i> .....	18
2.4 THEORY OF REMOVAL MECHANISMS .....	20
2.5 SORBENT .....	23
2.5.1 <i>Point of zero charge</i> .....	24
2.5.2 <i>Zeolite</i> .....	26
2.5.2.1 <i>Zeolite - point of zero charge</i> .....	26
2.5.2.2 <i>Cation (metal ions) removal</i> .....	27
2.5.2.3 <i>Anion (fluoride) removal</i> .....	28
2.5.2.4 <i>Organics removal</i> .....	30
2.5.2.5 <i>Clinoptilolite</i> .....	31
2.5.3 <i>Calcite</i> .....	34
2.5.3.1 <i>Metal ions removal</i> .....	34

2.5.3.2 Fluoride removal.....	35
2.6 KINETICS .....	36
2.6.1 Rate law of chemical reaction.....	38
2.6.2 Kinetic models.....	41
2.6.2.1 First order kinetics .....	41
2.6.2.2 Second order kinetics.....	42
2.6.2.3 Pseudo-second order kinetics (PSO) .....	43
2.6.2.4 Intra-particle diffusion (IPD) .....	44
2.6.2.5 Power model.....	44
2.6.2.6 Elovich model.....	44
2.6.2.7 Hill models .....	45
2.6.2.8 Applications .....	47
2.7 CONTAMINANT TRANSPORT .....	48
2.7.1 Advection .....	49
2.7.2 Diffusion.....	50
2.7.3 Dispersion .....	51
2.7.4 Retardation.....	53
2.7.5 Transport modelling.....	55
2.7.5.1 ADE model .....	56
2.7.5.2 Other models .....	57
2.8 LABORATORY STUDIES.....	58
2.9 GEOCHEMICAL MODEL - PHREEQC .....	59
2.10 OBJECTIVES .....	59
<b>CHAPTER 3 MATERIALS AND METHODS .....</b>	<b>61</b>
3.1 MATERIALS.....	61
3.2 SYNTHETIC SOLUTIONS.....	62
3.3 EXPERIMENTAL METHODS.....	66
3.3.1 Zeolite surface charge.....	66

---

3.3.2 Batch reactor kinetics tests.....	67
3.3.3 Column tests .....	69
3.3.4 Chemical and pH analysis .....	71
3.4 MODELLING .....	72
3.4.1 Kinetic modelling .....	72
3.4.1.1 Model fitting evaluation .....	72
3.4.1.2 Error analysis.....	74
3.4.1.3 Confidence contour analysis.....	75
3.4.2 Transport modelling.....	76
3.4.3 Geochemical modelling.....	77
<b>CHAPTER 4 BATCH REACTOR KINETICS TEST — ZEOLITE .....</b>	<b>78</b>
4.1 ZEOLITE PORE SIZE DISTRIBUTION AND SURFACE AREA.....	78
4.2 SURFACE CHARGE .....	78
4.3 THE EFFECT OF $Mn^{2+}$ , $Cd^{2+}$ , $Ba^{2+}$ METAL IONS ON DEFLUORIDATION .....	79
4.3.1 $Mn^{2+}$ .....	79
4.3.2 $Cd^{2+}$ .....	84
4.3.3 $Ba^{2+}$ .....	86
4.3.4 Removal mechanism.....	89
4.4 KINETIC MODELLING .....	91
4.5 THE EFFECT OF STIRRING RATE .....	101
4.6 CONCLUSION .....	104
<b>CHAPTER 5 BATCH REACTOR KINETICS TEST — CALCITE .....</b>	<b>106</b>
5.1 SPECIATION MODELLING.....	106
5.2 CALCITE SURFACE AREA .....	108
5.3 KINETICS .....	109
5.4 CONFIDENCE CONTOUR ANALYSIS.....	115
5.5 EFFECT OF MINERAL IONS ON FLUORIDE REMOVAL KINETICS.....	116

---

5.6 PHREEQC MODELLING .....	122
5.7 CONCLUSION .....	123
<b>CHAPTER 6 COLUMN TEST.....</b>	<b>125</b>
6.1 ZEOLITE COLUMN TESTS .....	127
<i>6.1.1 Experimental observation and CXTFIT .....</i>	<i>127</i>
<i>6.1.2 PHREEQC Modelling: zeolite .....</i>	<i>134</i>
6.2 CALCITE COLUMN TESTS .....	141
<i>6.2.1 Experimental observation and CXTFIT .....</i>	<i>141</i>
<i>6.2.2 PHREEQ Modelling: Calcite .....</i>	<i>151</i>
6.3 CONCLUSION .....	161
<b>CHAPTER 7 CONCLUSIONS AND FUTURE WORK .....</b>	<b>163</b>
7.1 CONCLUSIONS.....	163
7.2 RECOMMENDATIONS FOR FUTURE WORK.....	165

## **List of Figures**

Figure 2. 1 Hall-Héroult aluminium electrolysis cell.....	7
Figure 2.2 SPL waste pile at Aluminium smelter at different time period: (A) May 1975; (B) 3May 1978.....	12
Figure 2.3 The contaminant plume with groundwater flow vectors (July 2010) on Google Earth site map, the colour gets deeper in the place that has a higher contamination: (A) fluoride ( $\text{mg.L}^{-1}$ ) contaminant map; (B) pH contaminant map .....	14
Figure 2.4 Schematic of a permeable reactive barrier (PRB) (GW flow, groundwater flow direction) (Powell et al., 1998) .....	16
Figure 2.5 (A) effects of dental fluorosis; (B) effects of skeletal fluorosis .....	17
Figure 2.6 Probability of fluoride contamination in the groundwater around the world (Amini et al., 2008).....	20
Figure 2.7 A schematic example of the zeolite exchange process between $\text{Ca}^{2+}$ and the counter-balanced ions ( $\text{Na}^+$ ) on the surface of zeolite (Lower, 2013) .....	21
Figure 2.8 Various mechanisms of sorption of an ion at the mineral/water interface: (1) adsorption of an ion via formation of an outer-sphere complex (a); (2) loss of hydration water and formation of an inner-sphere complex (b); (3) lattice diffusion and isomorphic substitution within the mineral lattice (c); (4) and (5) rapid lateral diffusion and formation either of a surface polymer (d), or adsorption on a ledge (which maximizes the number of bonds to the atom) (e). Upon the particle growth, surface polymers end up embedded in the lattice structure (f);	

finally, the adsorbed ion can diffuse back in solution, either as a result of dynamic equilibrium or as a product of surface redox reactions (g) (Sparks, 2003).....	23
Figure 2.9 Modified electrical double layer model for calcite surface. $\delta$ is the unsatisfied partial charge on the ions at the terminated surface of bulk solids; $\zeta$ stands for zeta potential; $\psi_\delta$ is the potential of the Stern layer (Stipp, 1999a).....	24
Figure 2.10 An example of PZC for a hypothetical mineral (Railsback, 2006) ...	25
Figure 2.11 The fundamental building block of zeolite (Margreta et al., 2013) ....	27
Figure 2.12 The exchange process between $F^-$ and $OH^-$ from zeolite surface (Liu et al., 2011).....	29
Figure 2.13 The distribution of zeolite (MerchantResearch&Consulting, 2014) .	33
Figure 2.14 Transport process in a solid – liquid system: (1) transport in the solution phase; (2) move across a liquid film at the solid – liquid interface; (3) transport in a liquid – filled macropore; (4) surface diffusion; (5) micropore diffusion; (6) diffusion in the bulk of the solid (Aharoni and Sparks, 1991).....	38
Figure 2.15 Simple rate laws for A converts to B (Appelo and Postma, 2005)....	40
Figure 2.16 Transport processes of contaminants versus time along a flow path (Merkel and Planer-Friedrich, 2008).....	49
Figure 2.17 Porosity and effective porosity (Hamdani, 2014).....	50
Figure 2.18 Diffusion process (KC, 2014).....	51
Figure 2.19 Longitudinal and transverse dispersion (Appelo and Postma, 2005)	52
Figure 2.20 Retardation caused by sorption. Case A: no adsorption occurs with retardation equals to 1; Case B: sorption occurs with half of total mass are lost, retardation is 2 (Appelo and Postma, 2005).....	54

Figure 3.1 (A) schematic diagram for kinetics test setup; (B) the experimental setup in the lab, the atmosbag is used for gas injection reactions (not in this study) .....	69
Figure 3.2 (A) schematic diagram for column test setup; (B) the experimental setup in the lab .....	71
Figure 4.1 Point of zero charge ( $pH_{pzc}$ ) of natural zeolite (<150 $\mu\text{m}$ ) .....	79
Figure 4.2 The distribution of manganese speciation in the KF (200 $\text{mg.L}^{-1}$ ) and $\text{MnCl}_2$ solution: (a) initial $[\text{Mn}^{2+}]$ is 10 $\text{mg.L}^{-1}$ ; (b) initial $[\text{Mn}^{2+}]$ is 100 $\text{mg.L}^{-1}$ .....	81
Figure 4.3 The effect of redox reactions on the concentrations of free $\text{Mn}^{2+}$ : (a) and (b) initial $[\text{Mn}^{2+}]$ is 10 $\text{mg.L}^{-1}$ ; (c) and (d) initial $[\text{Mn}^{2+}]$ is 100 $\text{mg.L}^{-1}$ .....	81
Figure 4.4 Fluoride removal kinetics with model 95% CI's using zeolite (<150 $\mu\text{m}$ ) in the presence of manganese at 20 $^{\circ}\text{C}$ and stirring rate of 200 rpm. Initial $[\text{F}^-]$ ~200 $\text{mg.L}^{-1}$ , and initial concentrations of $\text{Mn}^{2+}$ are 0 (blank), 10, 100 $\text{mg.L}^{-1}$ respectively. Data sampled every 10 seconds, for clarity every 84 min points have been plotted. For $\text{Mn} \sim 100 \text{ mg.L}^{-1}$ data sampled every 10 seconds and plotted every 42 minutes (for $0 < t < 500 \text{ min}$ ) to show early part of curve .....	84
Figure 4.5 The distribution of cadmium speciation in the KF (200 $\text{mg.L}^{-1}$ ) and $\text{CdCl}_2$ solution: (a) initial $[\text{Cd}^{2+}]$ is 10 $\text{mg.L}^{-1}$ ; (b) initial $[\text{Cd}^{2+}]$ is 100 $\text{mg.L}^{-1}$ ....	85
Figure 4.6 The effect of redox reactions on the concentrations of free $\text{Cd}^{2+}$ : (a) and (b) initial $[\text{Cd}^{2+}]$ is 10 $\text{mg.L}^{-1}$ ; (c) and (d) initial $[\text{Cd}^{2+}]$ is 100 $\text{mg.L}^{-1}$ .....	85
Figure 4.7 Impact of cadmium ( $\text{Cd}^{2+}$ ) on fluoride removal with 95% CI's (<150 $\mu\text{m}$ ) at 20 $^{\circ}\text{C}$ and stirring rate of 200 rpm. Initial $[\text{F}^-]$ ~200 $\text{mg.L}^{-1}$ , and initial concentrations of metal ions are 0 (blank), 10, 100 $\text{mg.L}^{-1}$ respectively. Data sampled every 10 seconds, for clarity every 84 min points have been plotted.....	86

Figure 4.8 The distribution of barium speciation in the KF (200 mg.L <sup>-1</sup> ) and BaCl <sub>2</sub> solution: (a) initial [Ba <sup>2+</sup> ] is 10 mg.L <sup>-1</sup> ; (b) initial [Ba <sup>2+</sup> ] is 100 mg.L <sup>-1</sup> .....	87
Figure 4.9 The effect of redox reactions on the concentrations of free Ba <sup>2+</sup> : (a) and (b) initial [Ba <sup>2+</sup> ] is 10 mg.L <sup>-1</sup> ; (c) and (d) initial [Ba <sup>2+</sup> ] is 100 mg.L <sup>-1</sup> .....	87
Figure 4.10 Impact of barium (Ba <sup>2+</sup> ) on fluoride removal by zeolite (<150 µm) at 200 rpm. Initial [F] ~200 mg.L <sup>-1</sup> , and initial concentrations of metal ions are 0 (blank), 10, 100 mg.L <sup>-1</sup> respectively. Data sampled every 10 seconds, for clarity every 84 min points have been plotted.....	88
Figure 4.11 Pseudo-second order model (PSO), Hill, and intra-particle diffusion (IPD) model fits (<150 µm zeolite, 20 ± 0.2 °C, 200 rpm): (a) blank; (b) 10 mg.L <sup>-1</sup> Ba <sup>2+</sup> ; (c) 10 mg.L <sup>-1</sup> Mn <sup>2+</sup> ; (d) 10 mg.L <sup>-1</sup> Cd <sup>2+</sup> ; (e) 100 mg.L <sup>-1</sup> Ba <sup>2+</sup> ; (f) 100 mg.L <sup>-1</sup> Mn <sup>2+</sup> ; (g) 100 mg.L <sup>-1</sup> Cd <sup>2+</sup> . The observed Data sampled every 10 seconds, for clarity every 84 min points have been plotted .....	92
Figure 4.12 Pseudo-second order model (PSO), Hill, and intra-particle diffusion (IPD) model fits for the 1 <sup>st</sup> removal steps of 100 mg.L <sup>-1</sup> Ba <sup>2+</sup> samples (<150 µm zeolite, 200 rpm): (a) 20 ± 0.2 °C; (b) 26 ± 0.2 °C. The observed Data sampled every 10 seconds, for clarity every 84 and 31.5 min points have been plotted for (a) and (b) respectively .....	99
Figure 4.13 Fits of the experiments (<150 µm zeolite, 100 mg.L <sup>-1</sup> Ba <sup>2+</sup> , 200 rpm) to biphasic dose response (BiDoseResp) model: (a) 20 ± 0.2 °C; (b) 26 ± 0.2 °C. The observed Data sampled every 10 seconds, for clarity any every 84 min points have been plotted.....	100

Figure 4.14 The first ~300 minutes fluoride removal in the 10 mg.L <sup>-1</sup> Cd <sup>2+</sup> sample (Figure 4.7). Data sampled every 10 seconds, for clarity every 8.3 min points have been plotted .....	101
Figure 4.15 Impact of stirring rate on fluoride removal by zeolite (<150 µm) at 20 °C. Initial [F <sup>-</sup> ] ~200 mg.L <sup>-1</sup> , and stirring rates are 100, 200, 300 rpm respectively. Data sampled every 10 seconds, for clarity every 84 min points have been plotted .....	102
Figure 5.1 The effect of redox reactions on the concentrations of free metals: (a) and (b) Ba <sup>2+</sup> ; (c) and (d) Cd <sup>2+</sup> ; (e) and (f) Co <sup>2+</sup> ; (g) and (h) Mn <sup>2+</sup> . Initial [F <sup>-</sup> ] = ~200 mg.L <sup>-1</sup> ; initial [metal <sup>2+</sup> ] = ~0.1 mmol.L <sup>-1</sup> .....	107
Figure 5.2 The distribution of metal speciation: (a) Ba <sup>2+</sup> ; (b) Cd <sup>2+</sup> ; (c) Co <sup>2+</sup> ; (d) Mn <sup>2+</sup> . Initial [F <sup>-</sup> ] = ~200 mg.L <sup>-1</sup> ; initial [metal <sup>2+</sup> ] = ~0.1 mmol.L <sup>-1</sup> .....	108
Figure 5.3 The effect of metal ions (Co <sup>2+</sup> , Mn <sup>2+</sup> , Cd <sup>2+</sup> and Ba <sup>2+</sup> ) and type of calcite (stonedust and Iceland spar) on (a) fluoride removal and (b) pH. Initial [F <sup>-</sup> ] = ~200 mg.L <sup>-1</sup> ; initial [metal] = 0 or 0.101 ± 0.017 mmol.L <sup>-1</sup> ; stirring rate of 200 rpm; initial pH=~6.6; temperature 20 ± 0.2 °C. Data sampled every 10 seconds, for clarity any every 84 min points have been plotted. Note that all the tests conducted were using stonedust unless otherwise specified.....	110
Figure 5.4 Fits of experimental data to the pseudo-second order (PSO), Hill 4, Hill 5 and intra-particle diffusion (IPD) model: (a) blank (stonedust); (b) Iceland spar; (c) Ba <sup>2+</sup> ; (d) Cd <sup>2+</sup> ; (e) Co <sup>2+</sup> ; (f) Mn <sup>2+</sup> . The observed data sampled vary 10 seconds, for clarity any every 84 min points have been plotted. Initial [F <sup>-</sup> ] = 200 mg.L <sup>-1</sup> ; [metal <sup>2+</sup> ] = 0.101 ± 0.017 mmol.L <sup>-1</sup> ; temperature = 20 ± 0.2 °C; stirring rate = 200 rpm .....	111

Figure 5.5 Iceland Spar two-dimensional confidence contour plot showing the dependence of the normalised reduced sum of squares ( $RSS_{norm}$ ) on parameters $n$ and $E$ . Cross (+) in centre represents best fit .....	116
Figure 5.6 Far from equilibrium effects of metal ions ( $\text{Co}^{2+}$ , $\text{Mn}^{2+}$ , $\text{Cd}^{2+}$ and $\text{Ba}^{2+}$ ) on fluoride removal by calcite (stonedust and Iceland spar): (a) system pH evolution during the first 20 minutes of reaction; (b) $\text{F}^-$ removal during first 60 mins. Initial $[\text{F}^-] = \sim 200 \text{ mg.L}^{-1}$ ; initial [metal] = 0 or $0.101 \pm 0.017 \text{ mmol.L}^{-1}$ ; stirring rate of 200 rpm; initial $\text{pH} = \sim 6.6$ ; temperature $20 \pm 0.2^\circ\text{C}$ .....	122
Figure 5.7 PHREEQC modelling based on the parameters of pseudo-second order kinetics model (PSO): (a) blank (stonedust); (b) Iceland spar; (c) $\text{Ba}^{2+}$ ; (d) $\text{Cd}^{2+}$ ; (e) $\text{Co}^{2+}$ ; (f) $\text{Mn}^{2+}$ . For clarity any every 84 min points have been plotted for the PSO data .....	123
Figure 6.1 General framework of PHREEQC input file .....	126
Figure 6.2 Zeolite column test result of blank sample. Initial solution: $[\text{F}^-] = \sim 200 \text{ mg.L}^{-1}$ ; $[\text{Br}^-] = \sim 100 \text{ mg.L}^{-1}$ . (a) effluent pH values; (b) breakthrough curve of fluoride ( $\text{F}/\text{F}_0$ versus pore volume); (c) breakthrough curve of bromide ( $\text{Br}/\text{Br}_0$ versus pore volume) .....	128
Figure 6.3 Zeolite column test result of $\text{Ba}^{2+}$ sample. Initial solution: $[\text{F}^-] = \sim 200 \text{ mg.L}^{-1}$ ; $[\text{Br}^-] = \sim 100 \text{ mg.L}^{-1}$ ; $[\text{Ba}^{2+}] = \sim 10 \text{ mg.L}^{-1}$ . (a) effluent pH values; (b) breakthrough curve of fluoride ( $\text{F}/\text{F}_0$ versus pore volume); (c) breakthrough curve of bromide ( $\text{Br}/\text{Br}_0$ versus pore volume) .....	129
Figure 6.4 Zeolite column test result of $\text{Cd}^{2+}$ sample. Initial solution: $[\text{F}^-] = \sim 200 \text{ mg.L}^{-1}$ ; $[\text{Br}^-] = \sim 100 \text{ mg.L}^{-1}$ ; $[\text{Cd}^{2+}] = \sim 10 \text{ mg.L}^{-1}$ . (a) effluent pH values; (b)	

breakthrough curve of fluoride ( $F/F_o$ versus pore volume); (c) breakthrough curve of bromide ( $Br/Br_o$ versus pore volume).....	130
Figure 6.5 Estimation of $t_{0.5-tracer}$ for zeolite column blank sample (no metals) by fitting observed $Br^-$ BTC to the Hill 5 model ( $R^2 = 0.99$ ).....	134
Figure 6.6 Calcite column test result of blank sample. Initial solution: $[F^-] = \sim 200$ mg.L <sup>-1</sup> ; $[Br^-] = \sim 100$ mg.L <sup>-1</sup> . (a) effluent pH values; (b) experimental breakthrough curve of fluoride ( $F/F_o$ versus pore volume); (c) experimental and CXTFIT fitted breakthrough curve of bromide ( $Br/Br_o$ versus pore volume)....	143
Figure 6.7 Calcite column test result of $Ba^{2+}$ sample. Initial solution: $[F^-] = \sim 200$ mg.L <sup>-1</sup> ; $[Br^-] = \sim 100$ mg.L <sup>-1</sup> ; $[Ba^{2+}] = \sim 10$ mg.L <sup>-1</sup> . (a) effluent pH values; (b) breakthrough curve of fluoride ( $F/F_o$ versus pore volume); (c) breakthrough curve of bromide ( $Br/Br_o$ versus pore volume).....	144
Figure 6.8 Calcite column test result of $Cd^{2+}$ sample. Initial solution: $[F^-] = \sim 200$ mg.L <sup>-1</sup> ; $[Br^-] = \sim 100$ mg.L <sup>-1</sup> ; $[Cd^{2+}] = \sim 10$ mg.L <sup>-1</sup> . (a) effluent pH values; (b) breakthrough curve of fluoride ( $F/F_o$ versus pore volume); (c) breakthrough curve of bromide ( $Br/Br_o$ versus pore volume).....	145
Figure 6.9 SEM image (EDS spectra inset) of calcite exposed to tap water only .....	147
Figure 6.10 SEM image of calcite exposed to 5 mg.L <sup>-1</sup> $Cd^{2+}$ . Arrow indicates 1000 $\times$ magnification .....	148
Figure 6.11 SEM image (back-scattered image, EDS spectra inset) of calcite exposed to 5 mg.L <sup>-1</sup> $Cd^{2+}$ .....	148
Figure 6.12 The impact of log_k solubility on $F/F_o$ : (a) blank; (b) $Ba^{2+}$ ; (c) $Cd^{2+}$ .....	160

## **Abstract**

Industrial wastewaters often consist of a complex chemical cocktail with treatment of target contaminants complicated by adverse chemical reactions. The impact of metal ions on the removal of fluoride by natural zeolite and calcite was investigated in the present study via laboratory batch reactor kinetics and column tests.

In order to better understand the kinetics, the intra-particle diffusion (IPD), pseudo-second order (PSO) and Hill (Hill 4 and Hill 5) models were applied on the basis of kinetics test results. As these models have different numbers of parameters, model fitting was compared using the Akaike Information Criterion (AIC) and the Schwarz Bayesian Information Criterion (BIC) methods capable of comparing models having different numbers of parameters. The Hill models (Hill 4 and Hill 5) were found to be superior in describing the fluoride removal processes which reflects the process of chemisorption during fluoride removal. Results indicate that the presence of Mn ( $100 \text{ mg.L}^{-1}$ ) and Cd ( $100 \text{ mg.L}^{-1}$ ) respectively increase the rate of fluoride sorption by zeolite by a factor of  $\sim 28.3$  and  $\sim 10.9$ , with the maximum sorption capacity increased by a factor  $\sim 2.2$  and  $\sim 1.7$ . The presence of Ba ( $100 \text{ mg.L}^{-1}$ ) in the zeolite sample initially inhibited fluoride removal and very poor fits were obtained for all models. Fitting was best described with a biphasic sigmoidal model with the degree of inhibition decreasing with increasing temperature suggesting at least two processes are involved with fluoride sorption onto natural zeolite in the presence of Ba.

With calcite, results reveal that the presence of  $\text{Co}^{2+}$  adversely affects the process of defluoridation resulting in a lowest amount of fluoride removal in the order  $\text{Co}^{2+} < \text{stonedust}$  (a 99% pure natural calcite)  $\approx \text{Cd}^{2+} < \text{Mn}^{2+} < \text{Ba}^{2+}$ . Calculation of reaction half-lives ( $t_{0.5}$ ), a measure of the length of time required to remove 50% of the initial fluoride mass, showed that  $t_{0.5}$  increased in the order  $\text{Ba}^{2+} \approx \text{stonedust} < \text{Cd}^{2+} < \text{Co}^{2+} < \text{Mn}^{2+}$ , with  $\text{Mn}^{2+}$  and  $\text{Co}^{2+}$  requiring  $\sim 95$  and  $\sim 140$  minutes more to achieve half their respective predicted fluoride removal.

Column tests studying the effect of metal ions on fluoride transport in the presence of calcite or zeolite showed that the defluoridation efficiencies of zeolite and calcite are much lower than those in the batch tests, being only  $\sim 49\%$  and  $\sim 20\%$  respectively. This is attributed to the fact that the contact between sorbent and sorbate are temporal and spatial in column tests with the residence time much less than experienced during kinetics tests. The addition of  $\text{Ba}^{2+}$  and  $\text{Cd}^{2+}$  in the zeolite column sample respectively decreases the fluoride removal by  $\sim 13\%$  and  $\sim 10\%$  after four pore volumes had passed through the column while in the calcite sample,  $\text{Cd}^{2+}$  has similar defluoridation amount with the blank (no metals) and the presence of  $\text{Ba}^{2+}$  lowered the amount by  $\sim 8\%$  at 4.5 PV. CXTFIT a program to model 1D transport processes was used to fit the tracer ( $\text{Br}^-$ ) data from each column test. This allows the column characteristics such as the effective porosity, Darcy velocity, and dispersity to be calculated and used to assess the retardation of fluoride. PHREEQC geochemical modelling was also applied to both the kinetics data and the column experimental results. Modelling of the column tests using calcite required the addition of a hypothetical phase with a different solubility than calcite. By varying  $\log k$ , calcite solubility can be changed with an

increasing log k indicating an enhanced calcite dissolution. It is found that the best match achieved between the observed and modelled calcite column data when log k is 1.1, 0.75, 1.2 for the blank, Ba<sup>2+</sup> and Cd<sup>2+</sup> samples respectively. This implies that calcite dissolution is suppressed by the presence of Ba<sup>2+</sup>, which is inconsistent with the findings in the batch reactor kinetics tests. As for the zeolite columns, the log k of LinearF<sup>-</sup> which defines the phases and the associated hypothetical reactions with F<sup>-</sup> is altered by trial and error until the best fit is obtained. The log k of LinearF<sup>-</sup> used in the zeolite blank column is -100.05, while it changes to -100.22 in the presence of Ba<sup>2+</sup> and Cd<sup>2+</sup>. Results show good fits with the observed data. Geochemical modelling of the kinetics data however was more problematic with the initial instantaneous sorption part of the model curves closely matching the observed data, however the final part of the model curves over predicted fluoride removal. The initial development of the PHREEQ geochemical model presented here shows potential in being able to be used as a predictive tool for the design of fluoride remediation strategies such as permeable reactive barriers.
