

Diffusion Kinetics in Crystals

Tumpa Rani Paul

This thesis is submitted for the degree of

Doctor of Philosophy (Mechanical Engineering)

The University of Newcastle, Australia

Faculty of Engineering and Built Environment

School of Engineering

Centre for Mass and Thermal Transport in Engineering Materials

October 2017

Declarations

Statement of Originality

I hereby certify that the thesis contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying subject to the provisions of the Copyright Act 1968.

Thesis by Publication

This is to certify that the thesis is submitted in the form of a series of published papers of which I am a joint author. I have included as a part of the thesis a written statement from each co-author, and endorsed by the Faculty Assistant Dean (Research Training), attesting to my contribution to the joint publications.

Tumpa Rani Paul

Statement of Contribution

A written statement has been obtained from the following co-authors attesting my contribution to joint publications included as part of this thesis. Statements summarising and clearly identifying the nature and extent of the intellectual input by myself are included as part of the thesis.

Professor Graeme E. Murch

Professor Irina V. Belova

Professor Alan R. Allnatt

Dr Alexander V. Evteev

Dr Elena V. Levchenko

Dedication

To my parents

They always inspire me at every step in my life.

Acknowledgements

It is a great pleasure to concede my sincere gratitude to my principal supervisor Professor Graeme Murch for his generous advice, cooperation and support and for all of the opportunities I was given to conduct my research. His patience, motivation and immense knowledge are inspirational during these years and always be in my future journey. His guidance and persistent help for research and writing of this thesis are invaluable. I am very grateful to him for giving me the opportunity to do my research under his supervision.

I owe my deepest gratitude to my supervisor Professor Irina Belova. Without her continued concern on this work, enthusiasm, encouragement, guidance and support this study would not be possible for me. I would like to take this opportunity to express my profound thanks and sincere appreciation what she did to complete this journey.

I would like to thank the members of Centre for Mass and Thermal Transport in Engineering Materials, A/Prof. Thomas Fiedler, Dr Alexander Evteev, Dr Elena Levchenko, who provided valuable guidance and suggestions during this research work. I am also thankful to the other members of this group and my friends who provided helpful suggestions and advice both on academic and personal level.

In addition, I would like to thank the faculty and staff members in the Faculty of Engineering and Built Environment, School of Engineering. Special thanks to Ms Lea Petrovic, Ms Katherine Harrison, Ms Bec McIntyre and Mrs Sabrina Kesby for their help during my time at the University of Newcastle.

Furthermore, I am very grateful to the University of Newcastle for the financial support provided through a postgraduate research scholarship.

Finally, I wish to express my great debt to my husband, Ujjal Sarder, for his inspiration, generous help and encouragement to complete this venture. I am thankful for his love in my life. My special thanks to my parents for their love, motivation, moral support and endurance in my whole life. I also thank my parents-in-law, my brother-in law and my lovely sweet sister, for their love and kindness during my stay in Australia.

List of Symbols

| Arabic Symbols | |
|----------------------|--|
| Symbol | Description |
| a | Lattice parameter |
| a_i | Thermodynamic activity |
| A^* | Isotope of A atom |
| c_i | Composition (atomic fraction) |
| c_V | Vacancy fraction |
| D | Diffusion coefficient or diffusivity |
| D_0 | Pre-exponential factor |
| D_i^* | Tracer diffusion coefficient of atoms i |
| $D_i^{*(0)}$ | Uncorrelated part of tracer diffusion coefficient |
| D_i^{exp} | Experimentally obtained self-diffusion coefficients of species i |
| D_i^I | Intrinsic diffusion coefficient of species i |
| \tilde{D} | Interdiffusion or chemical diffusion coefficient |
| f_0 | Geometric correlation factor |
| f_i | Tracer correlation factor of species i |
| f_{ii} | Diagonal collective correlation factors |
| f_{ij}^i | Off-diagonal collective correlation factors |
| h | External/magnetic field |
| H | Energy |
| H_i | Vacancy escape frequency of species i |
| $\langle ij \rangle$ | Sum of all nearest neighbouring pairs of spins |
| J_i | Flux of species i in the crystal lattice reference frame |
| J_i^0 | Flux of species i in the laboratory reference frame |
| k | Boltzmann constant |
| L_{ij} | Onsager phenomenological coefficients or transport coefficients |
| $L_{ii}^{(0)}$ | Uncorrelated part of diagonal phenomenological coefficients |
| M_0 | Parameter directly related to the geometrical correlation factor f_0 |
| n | Number of atomic species |

| | |
|-----------------------|--|
| n_i, N_i | Total number of jumps of species i |
| N | Number of lattice sites per unit volume |
| p_V | Vacancy availability factor |
| P | Pressure |
| Q | Activation energy |
| r | Jump distance |
| Δr_i^2 | Mean-square displacement of an atom i |
| \mathbf{R} | Vector position of all atoms of species i |
| $\Delta \mathbf{R}_i$ | Vector displacement of all atoms of species i |
| s_i | Spin of species i |
| S | Vacancy-wind factor |
| t | Time |
| T | Absolute temperature |
| T_c | Critical temperature |
| v | Velocity of lattice reference frame relative to the laboratory reference frame |
| V | Volume, Ordering energy |
| V_{ij} | Nearest-neighbour interaction energy |
| w_i | Atom-vacancy exchange frequency of atomic species i , jump frequency |
| x_k | Kirkendall shift in the x direction |
| X_i | Driving forces of species i |
| X_V | Effective forces acting on vacancies |

| Greek Symbols | |
|---------------|-------------------------------------|
| Symbol | Description |
| γ_i | Activity coefficient of species i |
| Γ_i | Jump rate of atomic component i |

Abstract

In this study, the full diffusion kinetics behaviour for phenomenological coefficients, interdiffusion coefficients and tracer diffusion coefficients of atomic components in crystalline solids is investigated. The main theoretical approach for this investigation is the hierarchy of random alloy approximations. The combined analysis of tracer or self-diffusion coefficients with the interdiffusion coefficient is also performed. The basic information on the interrelation of the tracer and collective diffusion processes is provided by the chosen theory of diffusion kinetics. Furthermore, extensive Kinetic Monte Carlo (KMC) simulation results are used for the testing and development of analytical diffusion kinetics approaches for binary and multicomponent alloy systems.

As part of the present research, the solution to a problem that is often encountered in the experimental investigation on the self- and interdiffusion coefficients is considered. Namely, in the case of a binary alloy it is often necessary (via the Darken-Manning equation) to find the tracer diffusion coefficient where the other tracer diffusion coefficient and interdiffusion coefficient are available. Several numerical tests are performed to examine the solution and compared them with the available experimental data.

Further, in this study, the diffusion kinetics formalisms of Darken, Manning, Holdsworth and Elliott (HE), and Moleko, Allnatt and Allnatt (MAA) are analysed in detail. These formalisms are then extended and applied for the cases of multicomponent random alloy models. Moreover, a new version of the highly accurate MAA theory, called MAA-light, is developed for describing diffusion kinetics in multicomponent random alloys. In addition, the resulting expressions from the approaches are verified by means of KMC simulation and the possible range of the tracer diffusion coefficient ratio of the highest atomic mobility to the lowest atomic mobility is analysed. It is shown that the overall results for the theories are in reasonably good agreement with the simulation results. An iterative method for the case of the multicomponent system is also developed to find the uncorrelated parts of the tracer diffusion coefficients and tracer correlation factors with reasonable accuracy. In this research, the diffusion kinetics theory is focused on a special type of

multicomponent alloy, namely, high entropy alloys (HEAs). The self-diffusion and interdiffusion kinetics are investigated by extending and applying three diffusion kinetics approaches in the case of face centred cubic high entropy alloy $\text{CoCrFeMn}_{0.5}\text{Ni}$.
